

How to treat sprains and strains

A sprain occurs when one or more of your ligaments have been stretched, twisted or torn. A strain occurs when the muscle fibres stretch or tear. You can treat most sprains and strains at home and your symptoms should improve in a few days:

- Protect the affected area by supporting it, for example by resting a sprained ankle on a cushion.
- Rest up as much as possible to take pressure off the injury.
- Use an ice pack for 20 minutes every 2-3 hours, use a tea towel to stop the ice being in direct contact with skin.
- Once the swelling has started to go down, use a bandage to compress the area and provide further support.
- Elevate the affected area by raising above the level of your heart, for example by lying down and raising an injured leg with cushions.
- For painful sprains or strains, paracetamol is usually recommended and your local pharmacy can give advice.

Most injuries will heal within a few days. If you are still experiencing symptoms or the pain is getting worse, please call NHS 111 or your GP for advice.

NHS 111 is a free 24 hour service and will give you healthcare advice or direct you to the local service that is best for you.
